

Qognify See it, Send it Suite

The smartest sensor is you

Today, almost everybody carries a smart phone capable of sending messages and capturing exactly what is happening through images and video, all with accurate location. So what makes these devices into a smart sensor? It is the fact that human consideration is in the loop. We decide what is worth recording, capturing and sending, and when that makes most sense. We have been doing this for years as it relates to social media so sharing what we see has become muscle memory. Qognify Field Application Suite harnesses this unique combination of advanced technology, which is at everyone's reach, with the ability to apply human logic and analysis.

The field application suite

- **SeelSendIt** – enables users, in any location, to communicate and report through their mobile phone, on incidents, risk, unknown suspects, and provide textual, visual and geographic information instantly.
- **Live Video Broadcast** - allows field personnel to broadcast live video directly into the control room, turning every smartphone into a surveillance camera.
- **GuardMe** – A guard dispatch application that provides operators with simple Computer Aided Dispatch (CAD) functionalities including dispatching the closest person to the incident, dynamic routing, notifications and comments directly to guards' smart phones.
- **TrackMe** - provides users with a simple personal security service to monitor their progress from point A to point B, alerting authorities to potential route violations, such as failure to arrive safely or when a panic button is activated.
- **Qognify's Visual Intelligence Command Center (VICC)** – is a desktop application that collects and aggregates the information from the various mobile applications, presenting it on a map - enabling control room operators to get complete situational awareness of the incident being reported. It also allows them to send critical bulletins to users that include photo's, video and textual description.

Key Features and highlights:

- **Real-time, accurate and visual field information**
 - Qognify See it, Send it suite leverages smart phones, in order to provide information on events, risks and concerns, using text, images and video broadcasts - easily and instantly
- **Geo-referenced information**
 - Utilizing the smart phone's embedded GPS, the See it, Send it suite tags all information with its geographic location for immediate placement on the VICC map display
- **Live and recorded mobile video**
 - Increases your surveillance coverage by turning your users smartphones into a video broadcasting device, streaming video directly from the report location into the control room allowing dispatchers to save the recorded video for later use or to issue a bulletin for a suspect at large or a missing child, for instance
- **Dynamic dispatch and routing of guards**
 - A simple Computer Aided Dispatch (CAD) solution, including: locating available resources nearest to the location, providing instruction on the best route to the location
 - Making communication effective with notifications and comments directly to the users smart phones
- **Personalized protection and monitoring services**
 - Provides end-users with simple personal security features to monitor their progress from point A to point B, alerting authorities to any failure to arrive safely
